

# Support Escalation Guide

Last updated: July 20, 2026

TEAM SHARE SNAPSHOT - JULY 20, 2026 This copy was refreshed against the current application routes, role rules, module inventory, and July 20 production-readiness record. Kokomo may continue its approved normal production use. Any wider school rollout, parent invitation wave, kiosk activation, billing activation, payment activation, ProCare retirement, or store release remains separately approval-gated. Confirm the named school and module have a dated GO before treating a workflow as live.

Use this for live-school support during the Kid City USA pilot and future customer rollouts.

## Severity Levels

### P0: Live System Down Or Data Exposure

Examples:

- Users cannot log in across multiple schools.
- Public inquiry intake is down.
- Location users can see another location's private data.
- Parent/child/custody/medical/billing data is exposed to the wrong user.
- Payment or payout flow behaves incorrectly in production.

Response:

- Stop related rollout work.
- Capture affected user, school, URL, timestamp, and screenshot.
- Check Vercel deployment/logs and Supabase status.
- Roll back or disable the affected feature if the issue is confirmed.
- Document the incident and follow up with affected stakeholders.

### P1: Critical Workflow Broken For One Or More Schools

Examples:

- A school cannot submit FTE.
- Leads are not creating for a selected location.
- ProCare import fails for a school during cutover.
- Kiosk check-in cannot be used at a live school.

Response:

- Confirm whether the issue is role-specific or location-specific.
- Reproduce with the affected role if possible.
- Check API logs and recent deployment changes.
- Apply a targeted fix or documented workaround.
- Confirm resolution with a production smoke test.

### P2: Important But Workaround Exists

Examples:

- Report export has a formatting problem.
- Notification dropdown is missing a non-critical item.
- A dashboard card has stale data but the underlying module works.

Response:

- Log the issue with module, role, expected behavior, and actual behavior.
- Prioritize in the next patch release.
- Avoid risky production changes unless it blocks school operations.

### **P3: Cosmetic Or Future Enhancement**

Examples:

- Layout polish.
- Copy changes.
- New filters or convenience actions.

Response:

- Add to the backlog.
- Batch with related UX improvements.

## **Information To Capture**

- School/location name and location ID.
- User email and role.
- Page URL.
- Time and timezone.
- Steps to reproduce.
- Expected result.
- Actual result.
- Screenshot or screen recording if available.
- Whether the same issue happens for executive users.

## **First Checks**

- Confirm the user is signed into the correct account.
- Confirm the user is assigned to the expected center.
- Confirm the record belongs to the same center.
- Check `/api/health`.
- Check `/api/system/readiness` with an executive account.
- Check Vercel function logs for the affected route.
- Check Supabase database/API status.

## Data Safety Rules

- Never manually move production data across centers without confirming location ID and tenant.
- Never expose child, medical, custody, billing, or parent contact data in support screenshots beyond the minimum needed.
- Do not paste production secrets into tickets, docs, chat, or code.
- For imports, keep the source file, dry-run output, final batch ID, and rollback notes.
