

School Transition Setup And Cutover SOP - The BEE Suite

Updated: September 23, 2026

Audience: owners, directors, billing owners, and BEE Suite implementation support

Purpose: prepare one school in The BEE Suite through either a guarded existing-record import or a clean start, without inventing data, duplicating tuition, skipping safety validation, or treating technical setup as launch approval.

CURRENT GUIDE Complete and approve each gate for the named school. An import, invitation, payout connection, or successful software test does not approve the other gates.

The BEE Suite setup team should complete every reversible business-configuration step supported by approved school information. The school retains the final word on family and child facts, source exceptions, payout-bank entry on the provider-hosted page, invitation scope, and school-specific activation.

Figure: Independent school launch gates

1. Name The School, Owners, And Cutover Boundary

Record these items before setup work begins:

- School and location name
- Owner or authorized business representative
- Director and assistant director
- Billing owner
- BEE Suite implementation owner

- Support owner and first-week coverage
- Previous-system export date, when importing
- Data starting point: MOVE EXISTING RECORDS or START WITH A CLEAN WORKSPACE
- Previous system and export/as-of date, when importing
- Target transition date
- Last tuition service period to be invoiced or collected in the previous system, when importing
- First tuition service period to be invoiced or collected in The BEE Suite

Do not use a corporate-wide approval as a substitute for the named school's approval. For an imported school, if the last previous-system cycle and first BEE Suite cycle overlap, stop until the billing owner resolves the boundary in writing.

2. Choose And Save One Data Starting Point

Open School setup for the named school and choose exactly one path. Do not create a placeholder import for a new school and do not re-enter an operating school's roster by hand merely to avoid import review.

Path A - Move Existing Records

Use this path when an operating school has families, children, balances, schedules, staff, or history in another system.

- The BEE Suite setup team prepares the supported source adapter, mapping, duplicate review, and technical verification.
- The school supplies the complete, unchanged school-scoped source package through the approved secure workflow and confirms facts or exceptions that cannot be proven automatically.
- A source from a provider other than ProCare must have a reviewed adapter before upload. Directors are not expected to reshape exports or guess field mappings.
- The path is not complete until the latest exact import state has a whole-school verification marked READY_FOR_DIRECTOR_REVIEW and the director records final school-data confirmation.

Path B - Start With A Clean Workspace

Use this path for a new school that has no prior operating roster to import.

- The BEE Suite setup team prepares the school profile, classrooms, business configuration, forms, tuition and billing rules, integrations, templates, and technical checks from approved business information.
- The school adds real families, children, guardians, pickups, safety details, schedules, and classroom assignments as enrollment begins.
- If no current families are expected yet, record that fact explicitly. Do not create sample or placeholder people to make setup appear complete.
- Before final school-data confirmation, resolve any current family without a guardian, guardian without a reachable email or phone, or current child without a classroom.

Changing the saved path or changing roster/import evidence invalidates the prior data confirmation and requires a fresh review. Data confirmation does not activate any other launch gate.

3. Director ProCare Export And Import Review

The director or approved ProCare administrator must confirm that the export package belongs to the correct location and contains the records the school relies on.

Use DIRECTOR_PRO CARE_DATA_CLEAN_START_GUIDE.md as the required director procedure. The private source packages live under docs/procare-exports/<LOCATION>; raw/ is immutable source evidence and review/ contains derived working files.

1. Confirm the export date, school name, and ProCare location.
2. Confirm the required family, child, relationship, classroom, staff, balance, tuition, and safety reports were included.
3. Confirm the BEE Suite implementation team accepted the package or documented any missing reports.
4. Confirm an import-complete notice or reviewed exception list exists for the school.
5. Compare aggregate family, child, classroom, staff, balance, and enrollment counts with ProCare.
6. Review all records with custody, pickup, allergy, medical, or other safety restrictions.
7. Spot-check at least 10 representative families across different classrooms and billing situations.
8. Record each domain as VERIFIED, NEEDS CORRECTION, MISSING SOURCE, or NOT APPLICABLE, with the exact raw source path, counts, reviewer, and exception owner.

For every spot-check, verify:

- Children are linked to the correct family and classroom.
- Guardians, payers, email addresses, and phone numbers are correct.
- Emergency contacts and authorized pickups are correct.
- Custody, medical, allergy, medication, and permission information is accurate.
- Enrollment status, schedule, start date, and classroom assignment are correct.
- The current balance, credits, open invoices, and tuition information match the approved source records.

Stop and hold the affected records if a guardian, payer, pickup, emergency contact, family relationship, date of birth, classroom, balance, or safety field is missing or ambiguous. Do not invent a value to make the import appear complete.

Skip this section only when the saved starting point is START WITH A CLEAN WORKSPACE and the school has confirmed that no prior records are expected.

4. Owner Payout Setup

School payout onboarding is completed by the owner or another authorized business representative. It is separate from a parent's payment method and separate from any corporate software-fee ACH authorization.

1. Open only the approved secure Stripe-hosted onboarding link for the named school.
2. If the link expired, request a new link. Do not forward an old link between locations.
3. Confirm the page identifies the correct business and school before entering information.
4. Enter business, identity, tax, and payout-bank information directly in Stripe.
5. Never send bank account numbers, routing numbers, tax documents, identity documents, passwords, or Stripe credentials by email or text.
6. Complete every outstanding Stripe requirement.
7. Return to The BEE Suite and open Billing Settings.
8. Find the named school and select Check to refresh its payout status.
9. Require completed details, no outstanding requirement fields, charges enabled, and payouts enabled for that location.
10. Record only the completion date, authorized owner, status, and any remaining requirement. Do not copy bank-account details into the readiness record.

If Stripe does not show both charges and payouts ready, parent checkout remains off for that school. A connected account alone is not payout approval.

5. Director School And Staff Setup

The director validates the operational workspace before teachers, parents, or the lobby kiosk depend on it.

1. Sign in at <https://thebeesuite.io/directors> with the approved director account.
2. Confirm the correct school and role. Stop immediately if another school is visible.
3. Verify the official school name, address, time zone, phone, email, hours, director contact, notification recipients, and parent-facing name.
4. Verify every classroom name, age group, capacity, ratio, schedule, and active child assignment.
5. Verify current staff, role, school assignment, classroom assignment, and employment status.
6. Reconcile access in both directions against the school's approved staff roster. For each staff member expected to sign in, match the active application user, normalized email, Supabase Auth identity, and exact school/role grant. Verify the Auth account is not banned or disabled and has a usable password-login credential, since the application signs in with email and password; have the account holder prove login where needed without sharing their password. Record any unverified or unusable account as an access-GO blocker. Inventory **every active Prisma user with potential school access**, whether or not Auth currently permits a new login, including portfolio or elevated roles and accounts absent from the expected-login list. Review active DeviceSession records and the user's application sessionVersion; a prior signed application cookie can remain usable after an Auth ban, and a cookie without a device-session ID cannot be found by inventory. Before access GO, invalidate older cookies for every in-scope account by incrementing its session version through the separately approved identity/session gate and verifying old cookies are denied, or prove that issuance of cookies without device sessions has stopped and the full 12-hour cookie lifetime has elapsed. Merely reading the current version or revoking listed device sessions does not prove the untracked cookies expired. Treat any unexpected access or outstanding session as an access-GO blocker until its scope is approved or revoked and denial is verified. Review all active grants; the Prisma User .role and effective UserAccessGrant .role for this school must both match approved duties and scope, with any other grants separately justified. A grant alone does not constrain a wrong application role. Classify missing Auth identities as intentionally uninvited or blockers with the school owner. An active staff profile or grant alone does not prove login readiness. Do not create accounts, change access, or send invitations from this review.
7. Remove former staff from active operational lists through the approved staff process; do not change Auth access unless that separate gate is authorized.
8. Test one director and one teacher session. Each user must see only the correct school, classroom, children, documents, messages, attendance, and billing scope.

Wrong-school, wrong-classroom, or wrong-family visibility is an immediate stop condition.

6. Parent Portal Readiness

Parent invitations are a separate gate even when family data has been imported.

1. Confirm the guardian email and phone number on the family profile.
2. Confirm the guardian is linked to the correct family and children.
3. Reconcile parent access in both directions against the school's approved family/guardian relationships. For every parent expected to sign in, match the active Prisma user, normalized email, Supabase Auth identity, and exact Guardian.userId links to the approved family and children. Inventory every existing active parent/guardian application user and Guardian.userId link that could reach this school's family data, including accounts absent from the intended invitation list and former guardians. Check active DeviceSession records and account sessionVersion independently of Auth login status; an Auth ban alone does not revoke an application cookie. For any removed or unapproved relationship, use the separate identity/session gate to invalidate older cookies by incrementing session version and revoking active device sessions, or prove expiry after untracked-cookie issuance has stopped; verify old access is denied. Hold parent-access GO for any unresolved account, relationship, or session exception. Do not change real identities or send invitations from this review.
4. Use only the approved Parent Portal Access invitation or resend action. A current, safely linked family can be invited without requiring a ProCare import batch; unresolved identity or relationship conflicts still block access.

5. Do not send a broad invitation wave without the named school's approval.
6. If invitations were already sent, review the completion record and any delivery failures or manual-copy fallbacks.
7. Have an approved test parent sign in and verify family-only visibility before launch.
8. Tell parents to use the email and password in their welcome email. If they changed or forgot the password, they should use **Forgot password**.
9. Describe the Parent Portal as browser-installed: Safari **Add to Home Screen** on iPhone or iPad, Chrome **Install app** or **Add to Home screen** on Android, and the browser install option on desktop.

Stop if a parent sees another family or child, if a guardian email belongs to the wrong person, or if a missing child would require creating a duplicate record.

7. Teacher Portal And Attendance Readiness

1. Confirm each teacher is assigned to the correct school and classroom.
2. Confirm classroom rosters match the approved enrollment list.
3. Test check-in, check-out, attendance correction, daily report, incident, message, and media-permission workflows with approved test records.
4. Confirm the teacher can see only the assigned classroom scope.
5. Train teachers to confirm the child and saved state before switching records.
6. Keep the fallback attendance process available until the school has approved live use.

Do not launch teacher attendance if a child is missing, assigned to the wrong classroom, or visible outside the teacher's authorized scope.

8. Kiosk Check-In And Check-Out Readiness

Kiosk use is independent from parent invitations and teacher access.

1. Confirm the lobby device opens the center-specific kiosk.
2. Confirm each participating family has the correct PIN or QR credential.
3. Test a valid credential, invalid credential, check-in, duplicate check-in, check-out, and checkout-before-checkin.
4. Confirm only the correct family and children appear.
5. Verify authorized-pickup, custody, and signature warnings.
6. Confirm completed activity reaches the correct child, classroom, school, and attendance record.
7. Confirm the director's fallback process for a device, network, or credential failure.

Do not work around a custody, pickup, wrong-family, missing-child, or duplicate-attendance warning.

9. Billing And Payment Cutover

Billing configuration, live payments, and payouts are separate approvals.

1. Confirm the school, family, child, billing account, payer, and connected Stripe account before any billing action.
2. Reconcile opening balances, credits, open invoices, subsidies, fees, discounts, and recent payments with ProCare.
3. Confirm the recurring tuition assignment for each child, including amount, plan, start week, due date, and enabled status.
4. Confirm the family total equals the active per-child assignments.
5. For an imported school, confirm the last previous-system tuition cycle and first BEE Suite tuition cycle in writing. For four-week cadence, confirm every covered service week and the next unbilled period. For a clean-start school, record that no previous-system cycle exists.

6. Preview the first BEE Suite invoice cycle and review family count, child count, service period, amounts, exceptions, and duplicate risk.
7. Confirm payout readiness for the exact school.
8. Confirm the school absorbs Stripe processing costs, no parent processing surcharge is configured, and the refund, failed-payment, dispute, duplicate-payment, reconciliation, and parent-support owners are assigned.
9. Use an approved test payment only when test authorization and the test record are documented.
10. Record who will reconcile the first cycle and when the comparison will be completed.

Do not process the same tuition cycle in both systems. Do not enable autopay, create a live charge, retry a pending payment, or use Charge This Child Now merely because an invoice or payment method exists.

10. School-Specific GO Or NO-GO Record

Record each gate separately:

- ☐ Data starting point selected and saved for the named school
- ☐ Import package accepted and imported data validated, or clean-start state explicitly confirmed
- ☐ Latest school-data review is confirmed and has not become stale
- ☐ Every staff member expected to sign in has a reconciled application user, usable password-login Auth account, approved application role, and exact school grant; every active Prisma user with potential school access and any outstanding application/device session has been checked against the approved roster regardless of Auth login state; older untracked cookies have been invalidated or their expiry proved; intentionally uninvited staff and access exceptions are named, owned, and held off
- ☐ Director access tested
- ☐ Teacher access and rosters tested
- ☐ Every existing parent/guardian application account, family link, and outstanding session with potential school-family access is reconciled against the approved guardian roster; removed or unexpected access is denied before parent-access GO
- ☐ Parent invitations approved or intentionally held off
- ☐ Parent family-only visibility tested
- ☐ Kiosk approved or intentionally held off
- ☐ Tuition, balances, credits, and first-cycle preview approved
- ☐ School payout status shows charges and payouts ready, or live payments are intentionally held off
- ☐ Live payments approved or intentionally held off
- ☐ Previous-system/BEE Suite billing boundary recorded with no overlap, or clean start recorded
- ☐ First-week support and reconciliation owners assigned
- ☐ Previous-system retirement approved or intentionally held off, or not applicable for a clean start

Final decision: **GO / NO-GO**

Record:

- School / decision date and time:
- Modules approved for GO / modules held off:
- Bidirectional staff/account and application-session reconciliation evidence, intentionally uninvited staff, unexpected access, and blockers/owners:
- Bidirectional parent/guardian account, family-link, and session reconciliation evidence, unexpected access, and blockers/owners:

- Last previous-system tuition cycle / first BEE Suite tuition cycle, or clean-start note:
- Owner / director / billing / implementation approvers:
- Open exceptions, owner, due date, and exact retest:

HELD OFF is not PASS. Technical readiness is not approval to send invitations, activate the kiosk, bill families, process payments, or retire a previous system.

11. Launch-Day And First-Cycle Review

1. Confirm the school, approved modules, and support contacts at opening.
2. Monitor login, attendance, kiosk, parent access, invoice, payment, and payout exceptions.
3. Reconcile the first BEE Suite invoice and payment cycle against the approved cutover record.
4. Preserve all ledger, payment, import, and audit history when correcting an issue.
5. Record every exception with school, user, time, page, attempted action, expected result, actual result, affected record, screenshot or error, fallback, owner, and retest.
6. For an imported school, keep the previous system available as required by the written transition and records plan; discontinue its billing workflow only after the approved cutover boundary has passed and reconciliation is complete. For a clean-start school, retain the approved setup and enrollment evidence instead.

Stop And Escalate Immediately

- Another school, classroom, family, child, invoice, payment, document, incident, or report is visible.
- A guardian, pickup, custody, medical, allergy, or child relationship is wrong or ambiguous.
- The payout account belongs to the wrong school or Stripe shows outstanding requirements.
- A tuition cycle, invoice, payment, or balance would be duplicated between systems.
- A payment is applied twice, applied to the wrong invoice, pending without a clear owner, or routed to the wrong connected account.
- A parent or teacher cannot see the correct child or sees someone outside the approved scope.
- The kiosk shows the wrong family, ignores a warning, or records incorrect attendance.

Use SUPPORT_ESCALATION_GUIDE . pdf from the email packet and preserve the evidence before changing or deleting records.
